Hazzan Rob Menes

Natural Events

On May 20 in 1964, Robert Wilson discovered background radiation emanating from the cosmos, and he was awarded the Nobel prize for that in 1978. It gave evidence that the Big-Bang Theory might be valid. This was a reminder that there is something so much bigger than us, and a reminder that natural events and discoveries in physics and biology have implications about how we view our world. The pandemic is one of those events. One of the effects is that it has forced us to evaluate what is important for our relationships, what is the meaning of personal space, what is important in communication, and... who we value in society. At the Snider Campus, we value people of all ages, cultures, and beliefs, and we will always act to protect their health first. For us, the pandemic has intensified our mission, “to provide exemplary care to you and your family within a supportive and caring community, consistent with Jewish values and traditions.”
